

Ubuntu

For the key file, we perform the following process:

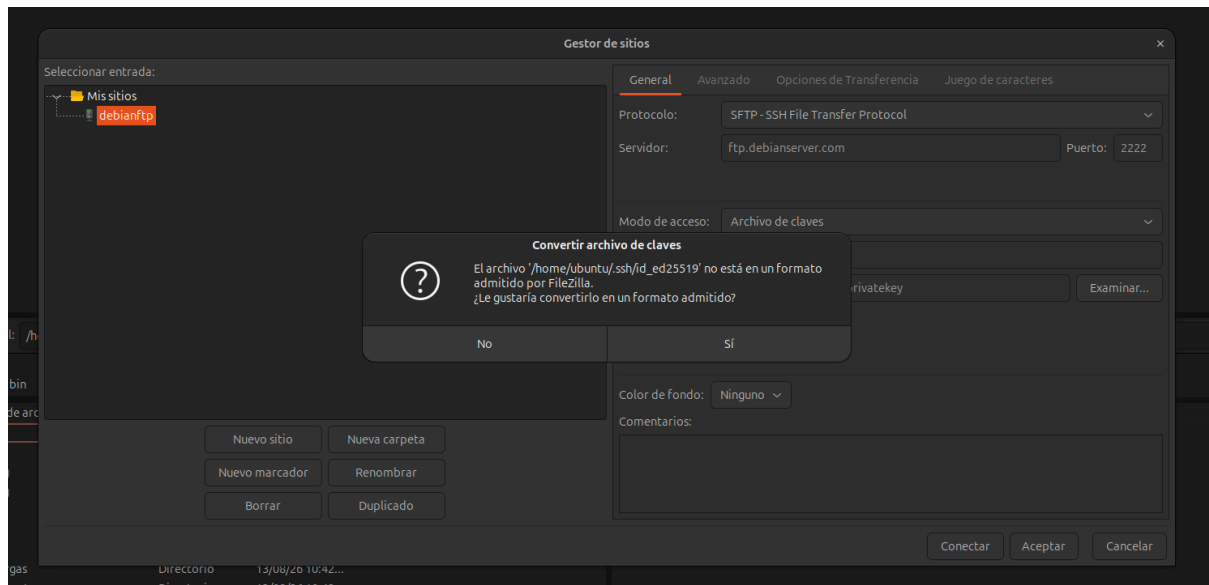

Click on browse and search for the private key in the hidden directory .ssh

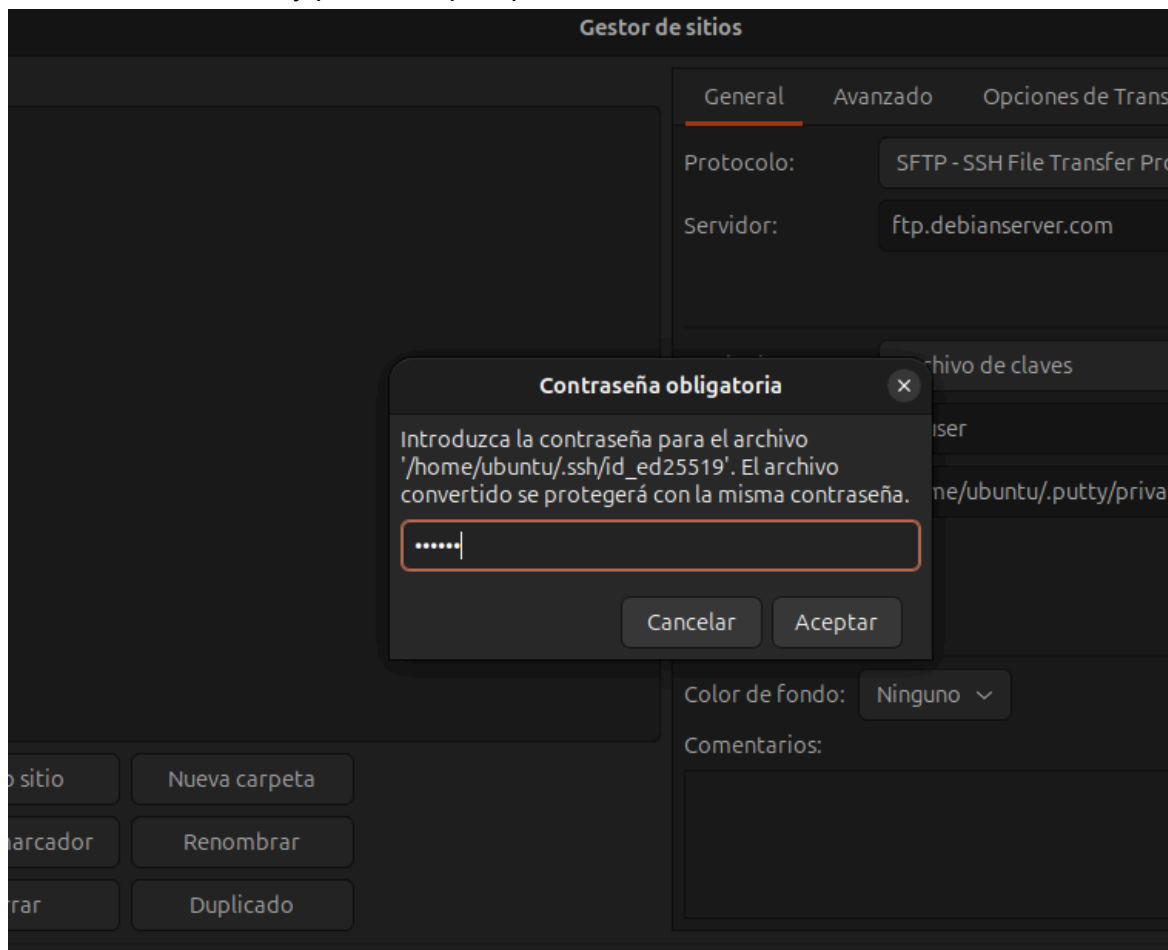

In the bottom right corner, we apply the "All files" filter and look for the private key (without the .pub extension). We select it and click the green "Open" button.

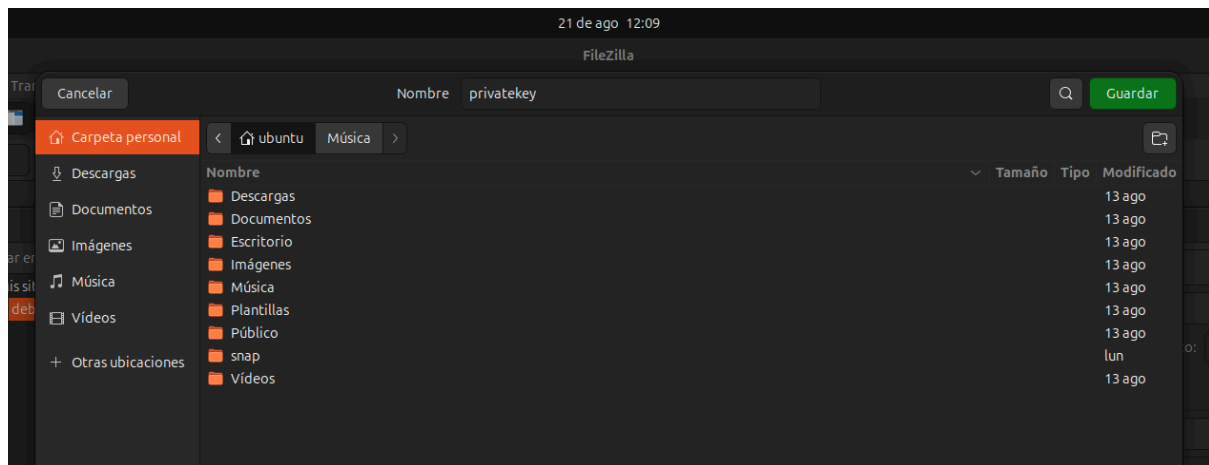

We will get this message from FileZilla, click "Yes",

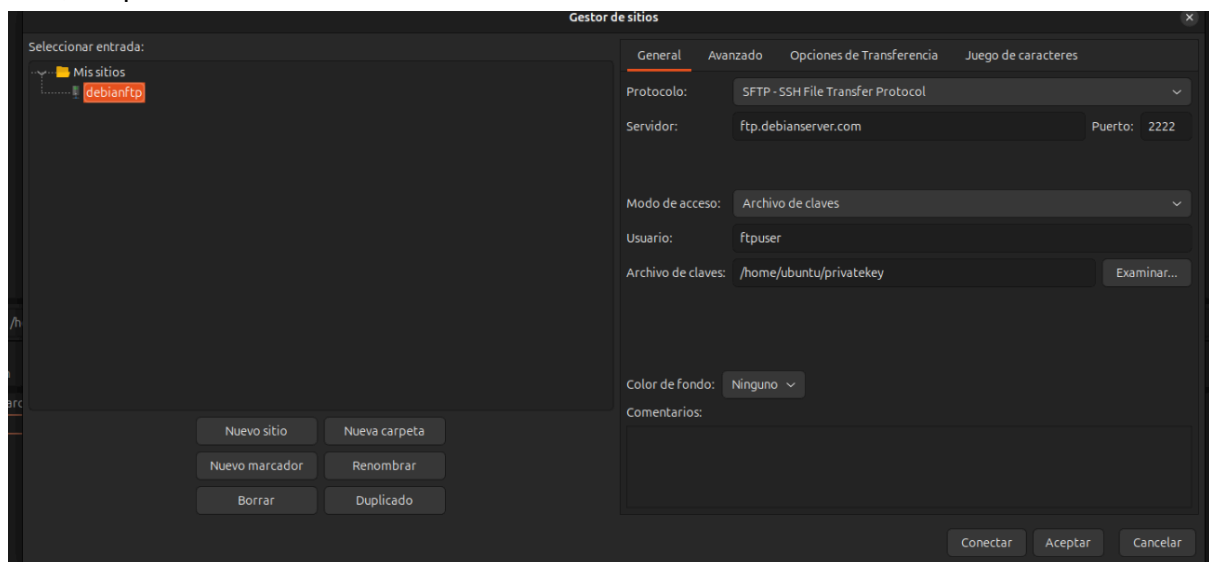

It will ask us for the key password/passphrase and we enter it.

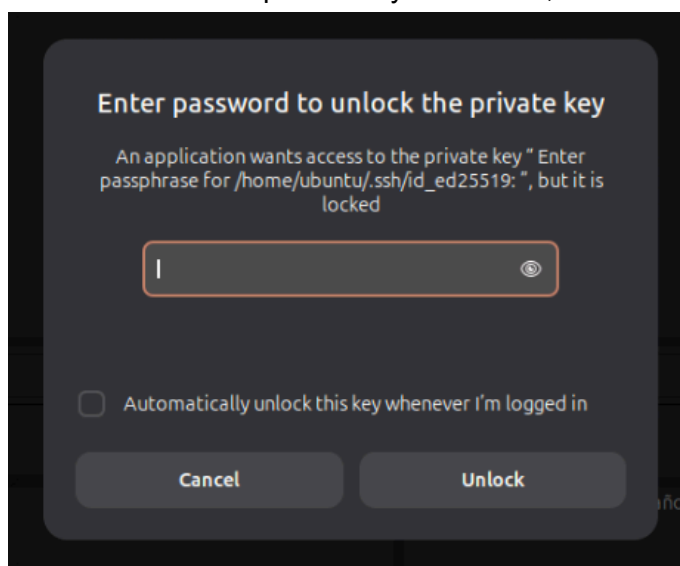

Now, it will ask us for a name and a location to save the new file. In my case, I will name it "privatekey" and save it in the directory /home/ubuntu/. We proceed to click the "Save" button.

Now, we press the Connect button.

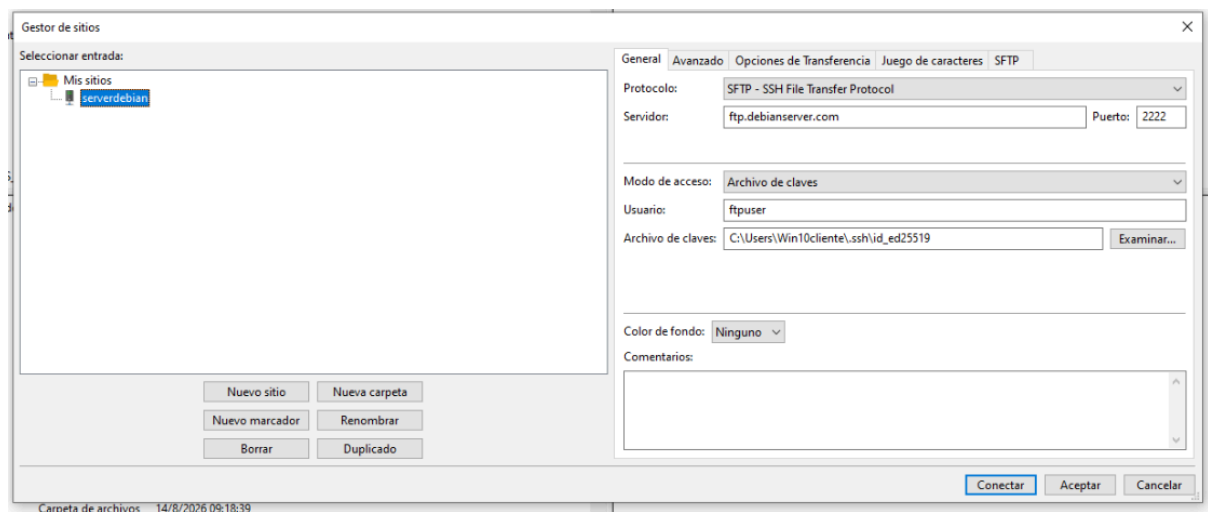

It will ask us for our private key. Therefore, we enter it.

Windows 10

We export our private key to FileZilla for SFTP access. We fill in the following fields:

For the private key, search in the directory **C:\Users\user\.ssh\id_ed25519**. Where "user" is the local user of the machine. Then we look for the private key id_ed25519. Next, we click on Connect, it will ask us for the password for the private key. Therefore, we provide it.
